

# PETRA III

## K. Balewski

- PETRA III Status
- Near future: PETRA III Extension

# Operation 2011

- About 9 month of user run ( $\approx 4800$  h)
- 1 summer shut down, 4 service weeks, 3 bunch patterns

	Februar	Maerz	April	Mai	Juni	Juli	August	September	Oktober	November	Dezember

# Beam Parameters 2011

Bunches		40	60	240
Beam Current	[mA]	85/80	100	100
Bunch Current	[mA]	2.1/2.0	1.7	0.42
Lifetime	[h]	2	2,5	10
Emittance hor.	[nm rad]	1	1	1
Emittance vert.	[pm rad]	10-20	10-20	10-20

Remarks: operating the machine in top-up without any problems  
 orbit stability within specs  
 record vertical emittance  $\varepsilon_y \approx 5 \text{ pm rad}$   
**# bunches ≥ 240: vertical beam blow up due to e-cloud**

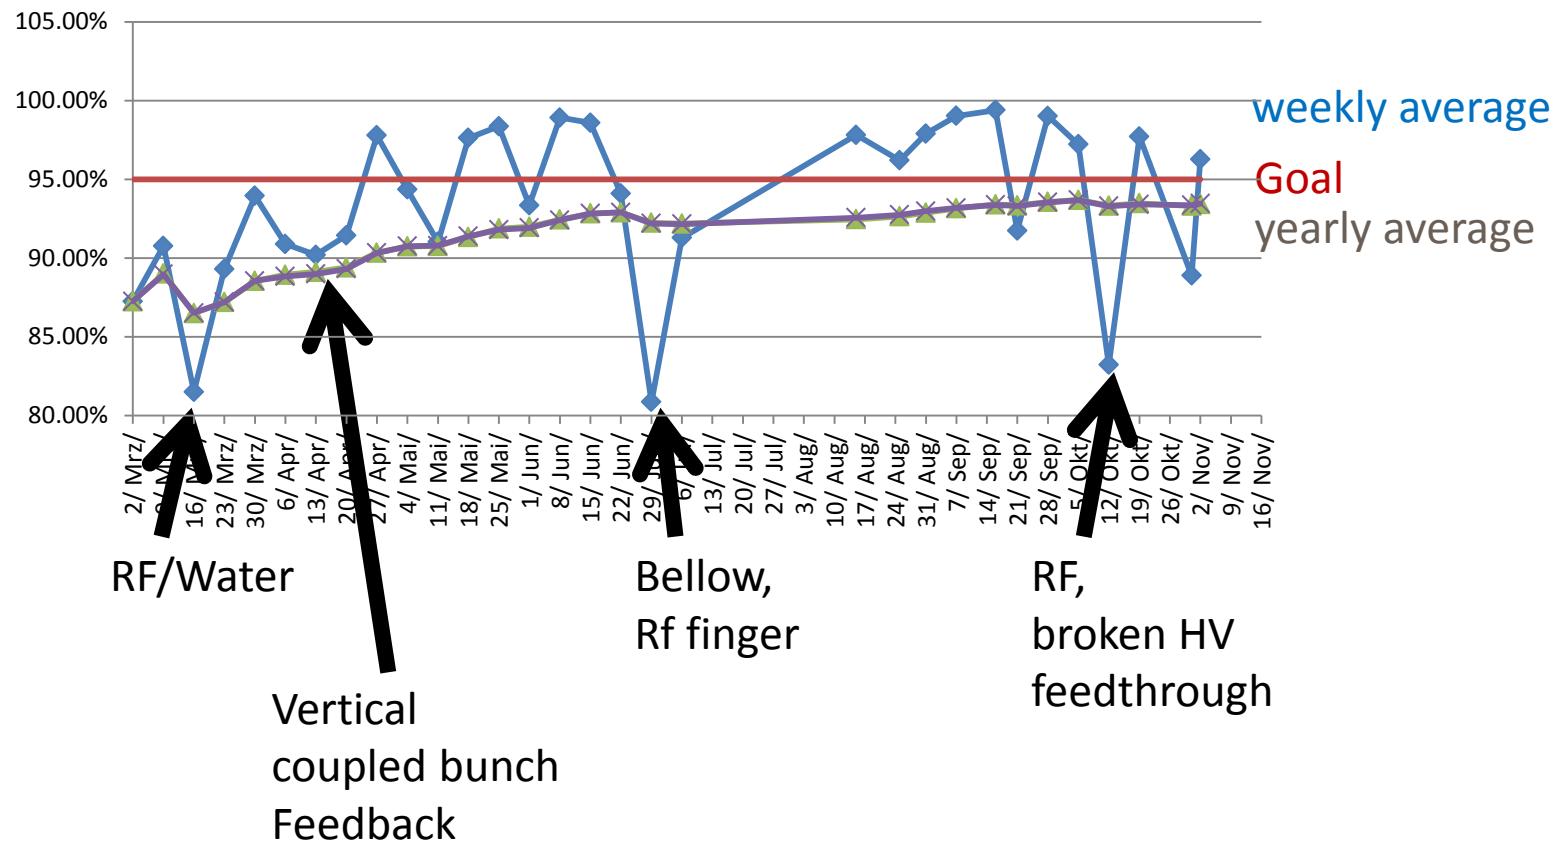

# Technical Problems

- A narrow Escape:

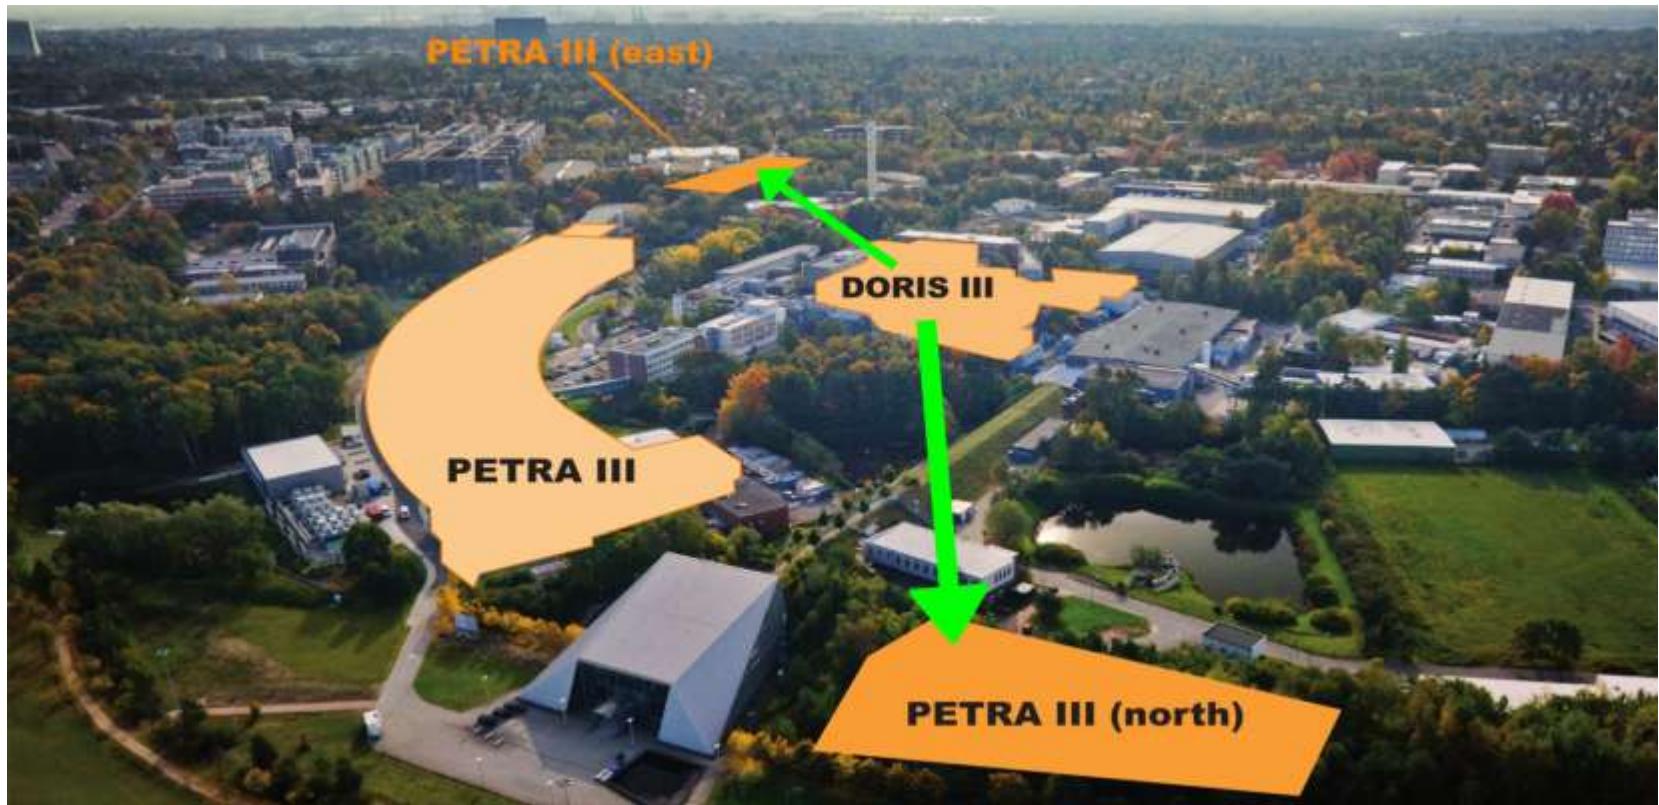

# Statistics 2011

## PETRA III Availability 2011

# PETRA III – Extension

- PETRA III beamlines in operation overbooked by app. a factor of 3
- DORIS end of operation end of 2012– end of Synchrotron-radiation operation October 2012
  - Move beamlines from DORIS to PETRA
- Additional beam lines for international partners: Sweden, India, Russia ...
- Down time due to extension should be as short as possible ( $\leq \frac{3}{4}$  a)

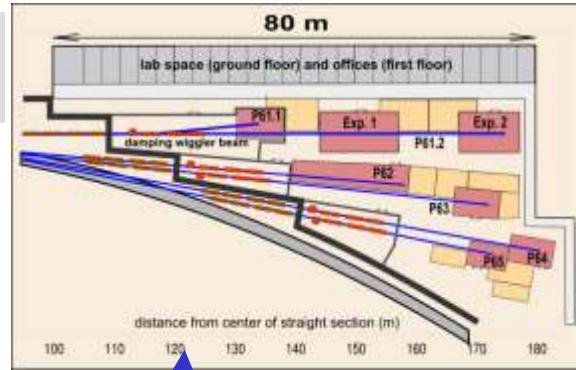

# New experimental Halls

## Hall North

### North

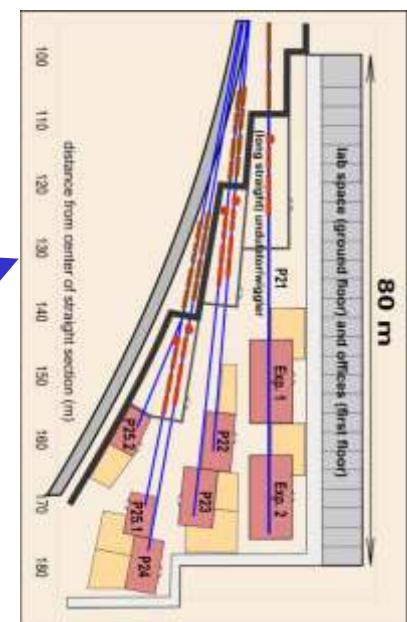

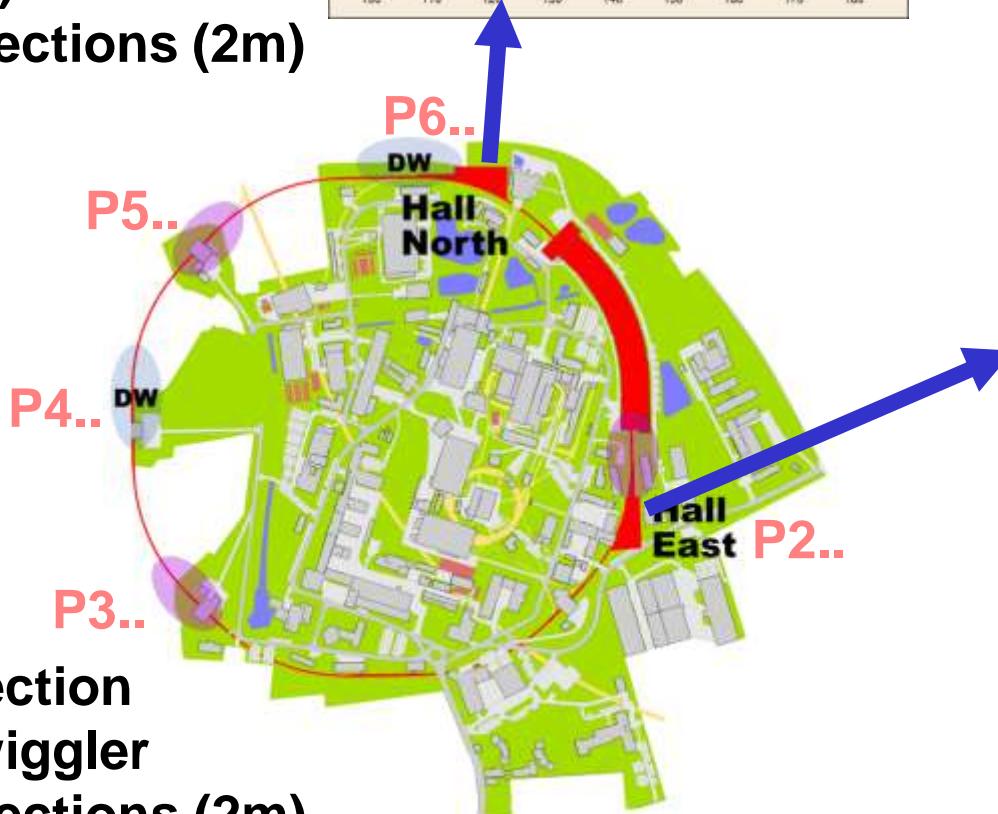

- o damping wiggler straight (already present)
- o 4 new straight sections (2m) in the arc

## Hall East

### East

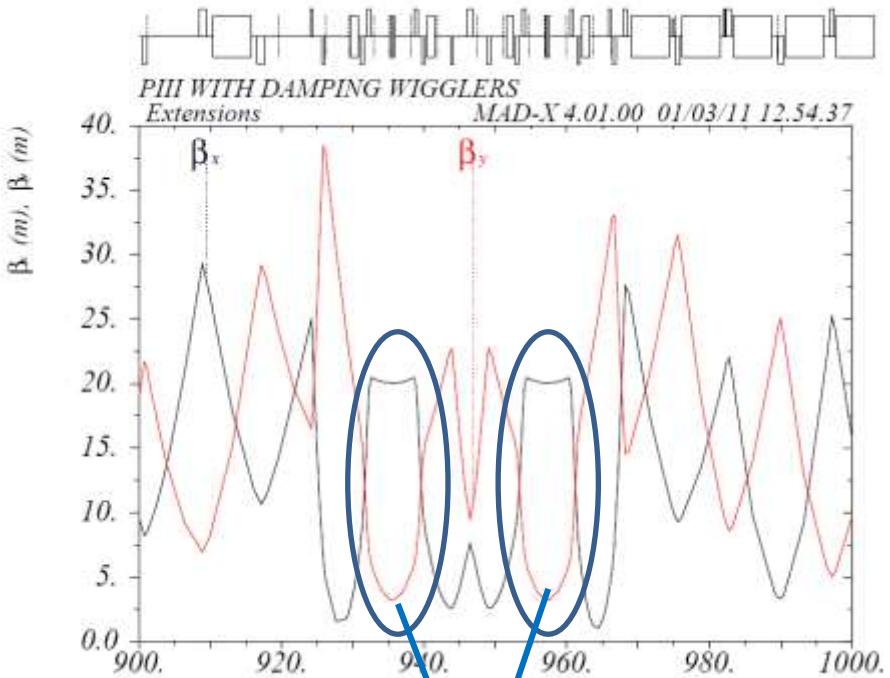

- o Long straight section for undulator / wiggler
- o 4 new straight sections (2m) in the arc

# Old and new optical layout

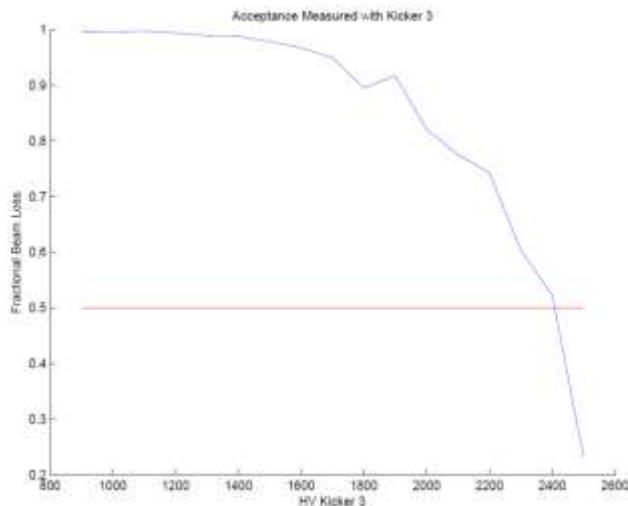

- Sextupoles have to be removed:  
10 SF and SD
  - Impact on off and on momentum aperture
- Impedance will increase
  - Impact on single bunch limit

## PIII 140 Sextupole

On momentum

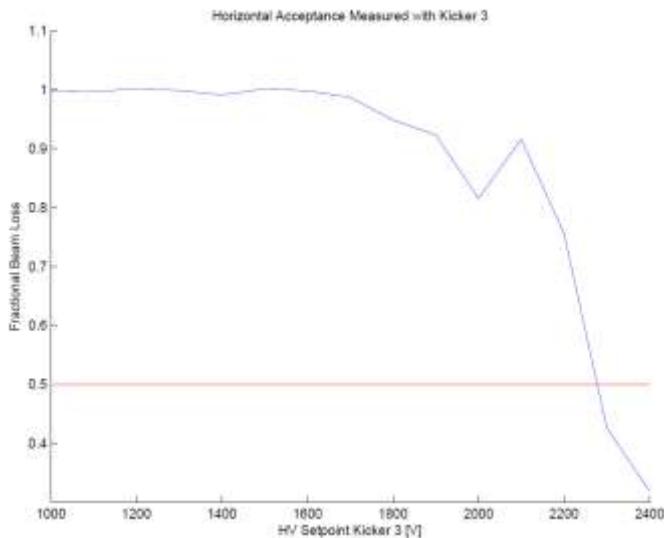

$A_x = 25.3 \text{ mm mrad}$

Off momentum

Toushek lifetime  
measurements: 1.6 %

## PIII ,extension' 120 Sextupole

$A_x = 22.8 \text{ mm mrad}$

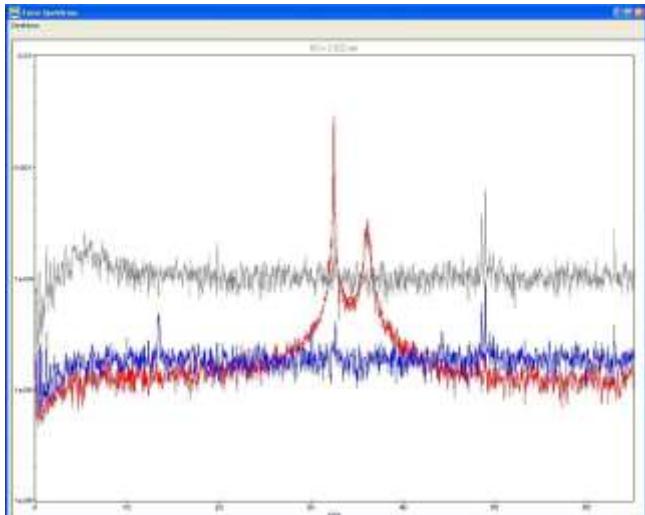

(expected from tracking 21 mm mrad)

Toushek lifetime  
measurements: 1.45 %

(expected from tracking 1.5 %)

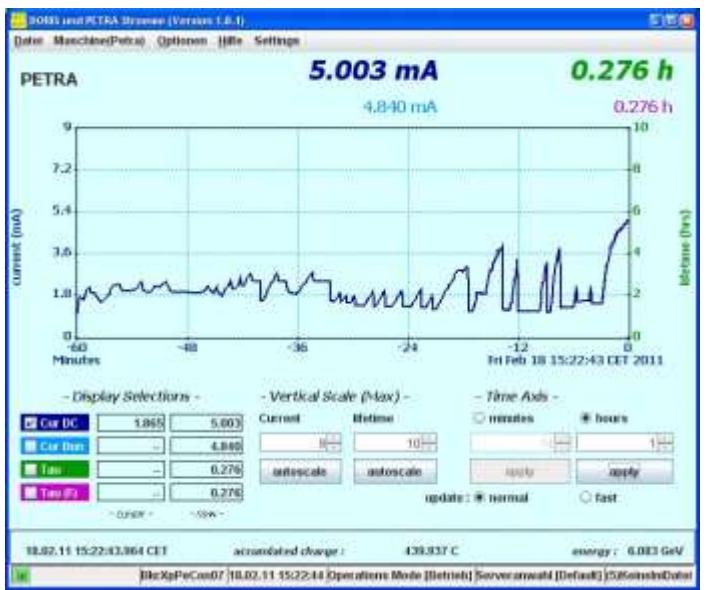

# Single bunch current limit

Without feedback single bunch current  
 Limited to 2.4 mA; probably limited by  
 Transverse mode coupling

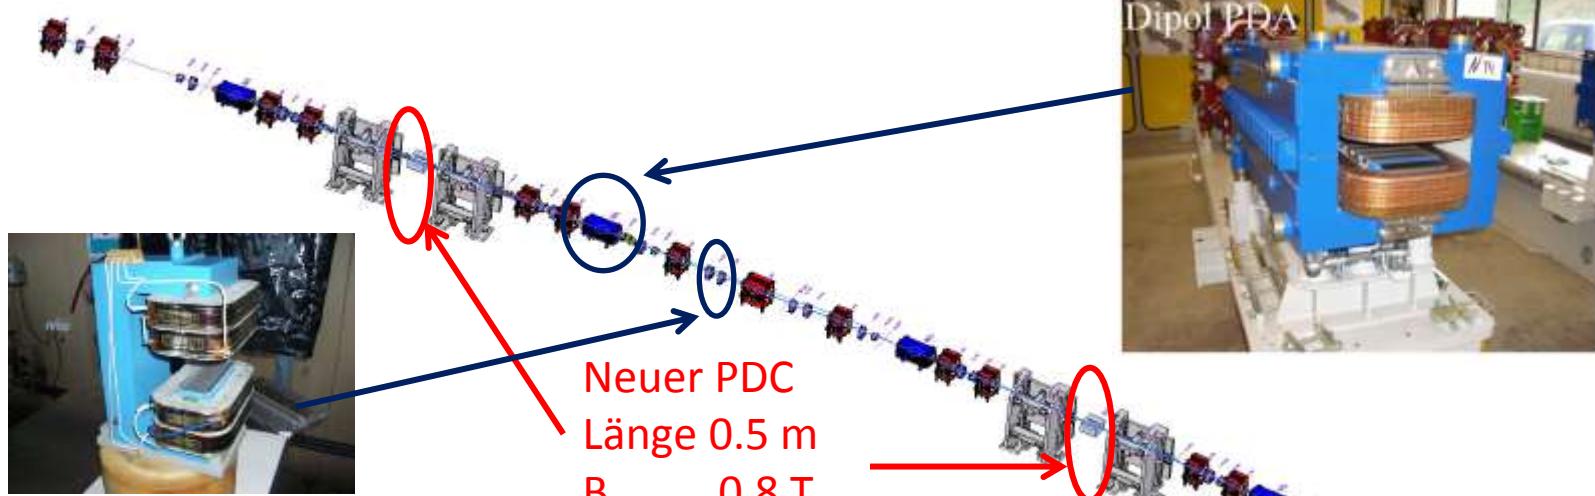

With feedback and increased vertical  
 Chromaticity (+6) 5 mA could be stored  
 (intentionally limited to 5 mA in order not  
 To destroy BPM electronics!)

This is two times more than required and the  
 Impedance increase is less than a factor of two!!  
 40 bunch mode should be possible even after  
 PIII extension!

# Hardware - Status

- Components identical with those of new octant
  - Magnets
  - Power supplies
  - BPM electronic and other diagnostics
- Simple concrete blocks as magnet supports

## Work in progress

- New design of vacuum system necessary including outlet chambers
- Air-conditioning
- **Photon beam stability (see below)**

# Photon beam stability

Radiat  
heavy

Measurements between segments of old octant and new octant

Indicate that the relative movement of the two buildings is almost negligible

Continue measurements in PETRA III to get a better  
idea of size and time scale of relative movement

In particular measurement of inclination of tunnel segments

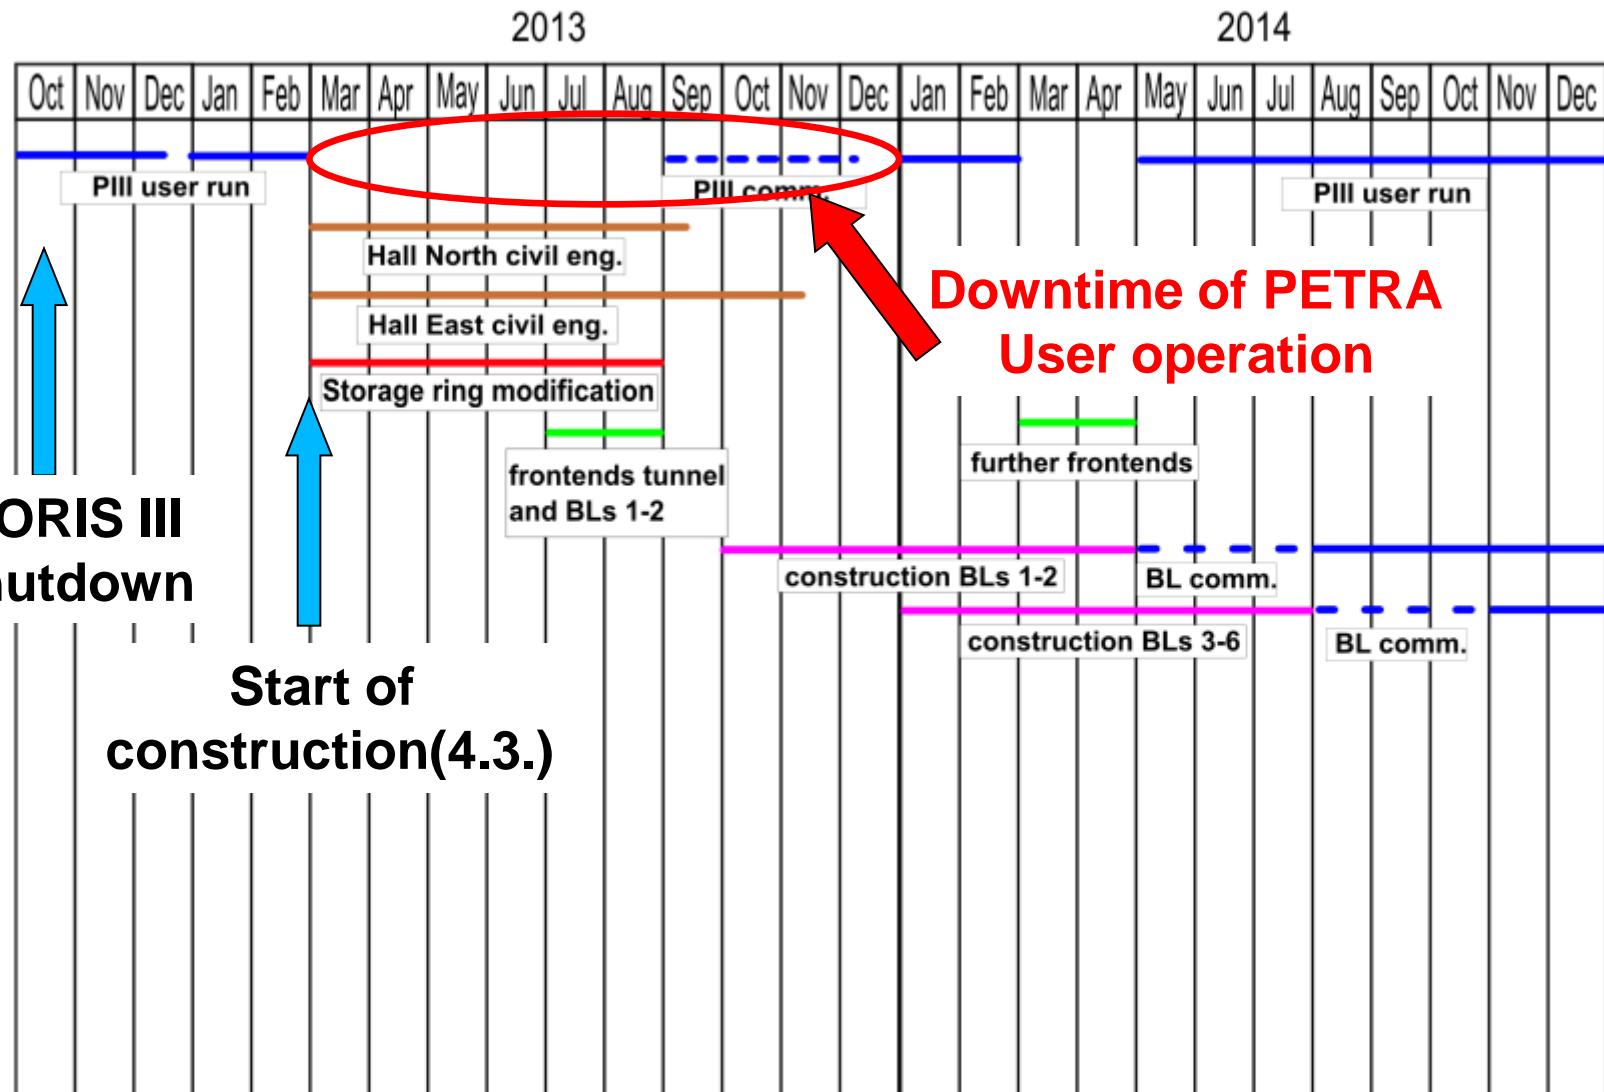

Methods to measure relative movement between new halls and old tunnel:

- X-Ray BPMs
  - First choice for straight section East
  - In the arcs potential problem with bending magnet radiation
- Tiltmeter to measure inclination of tunnel segments
- Hydrostatic Leveling system (only vertical measurement)
- Stretched wire system
- **Take these information into account for orbit feedback**

Modific  
acceler

# Schematic schedule (2013/2014)

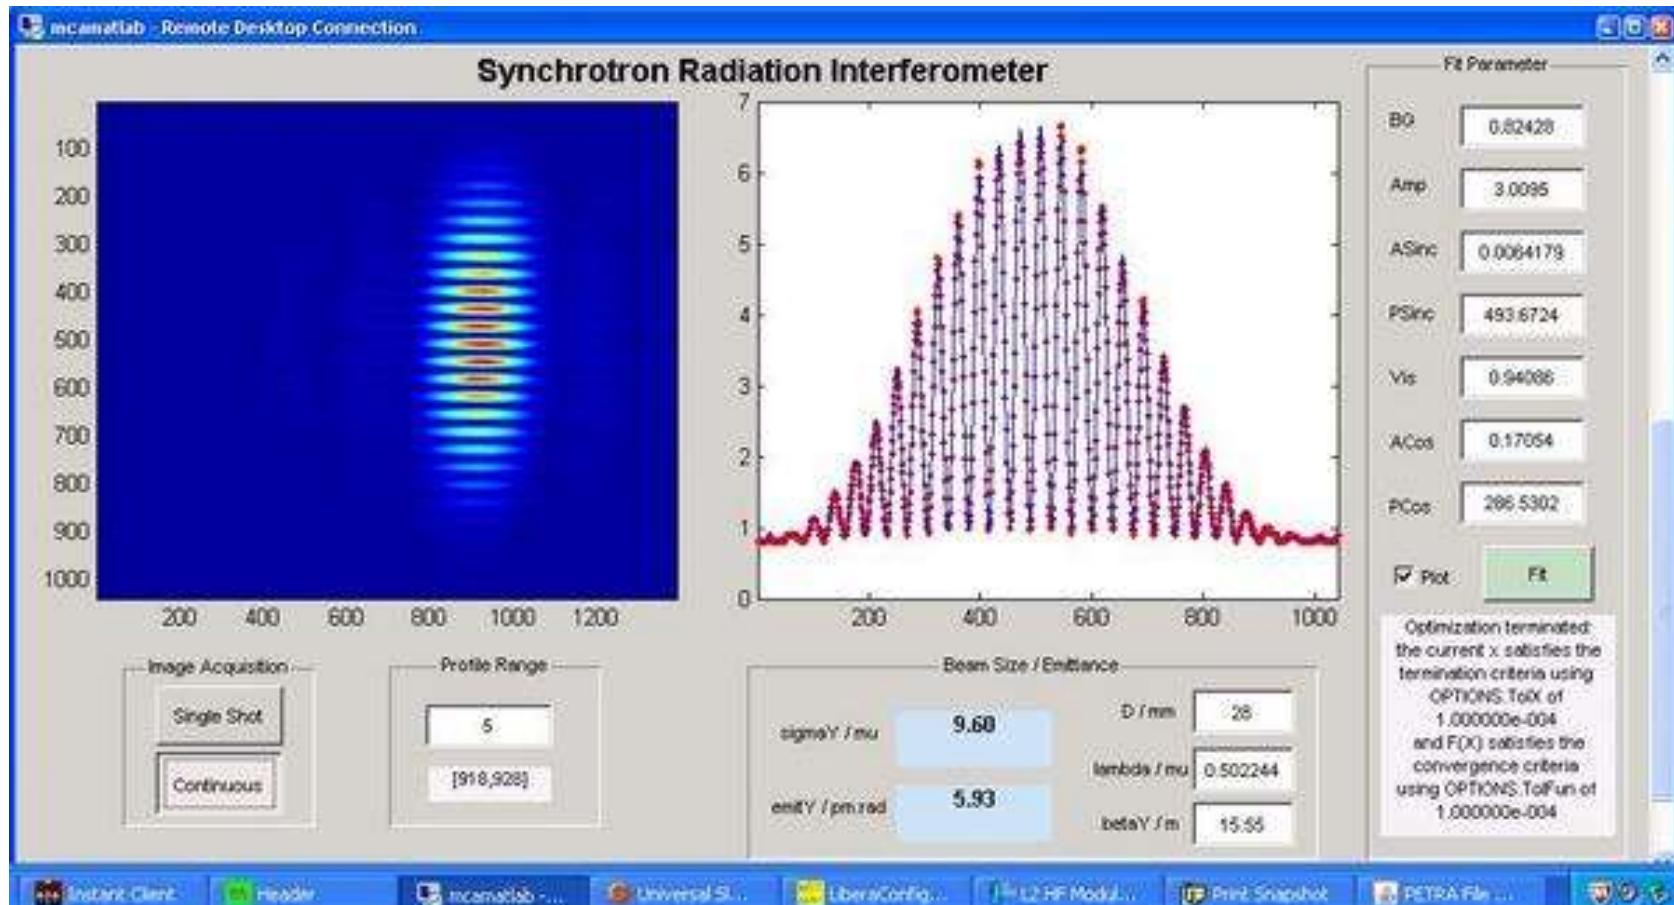

# Summary

- Status PETRA III:
  - Accelerator parameters basically within specs
  - Availability slightly less than 95%
- PETRA III extension
  - Work in progress in particular
    - Design of vacuum chamber
    - Detailed layout of building and construction work
    - Beam stability

Thank you  
for your attention

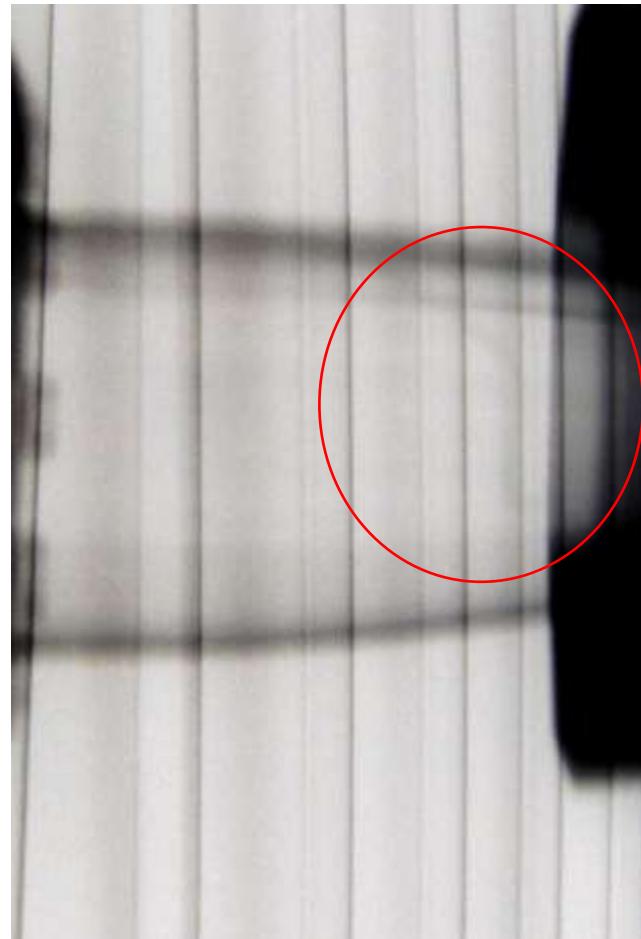

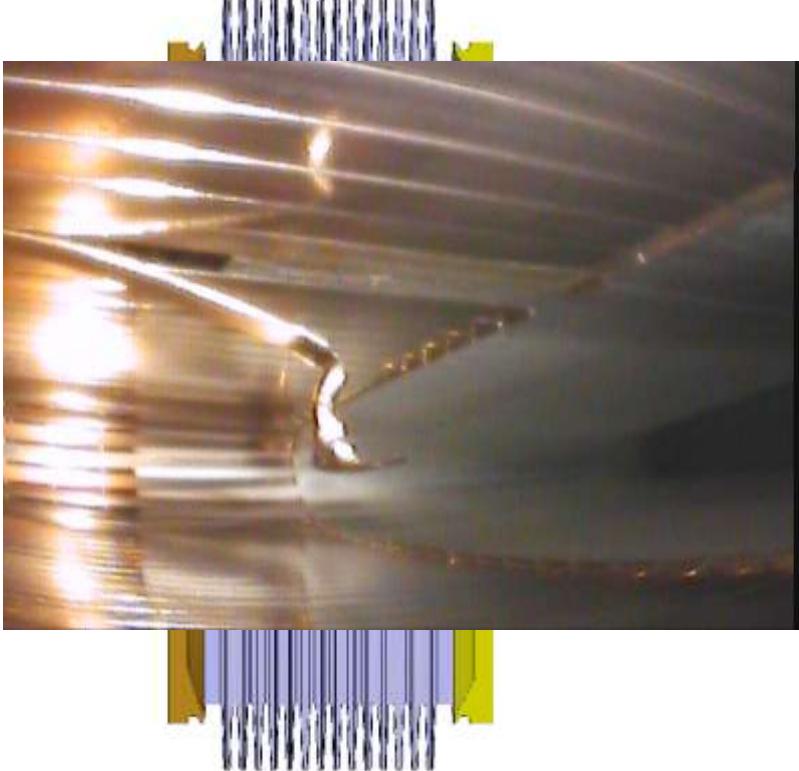

# Vertical emittance

# Technical Problems

- **Bellows:**

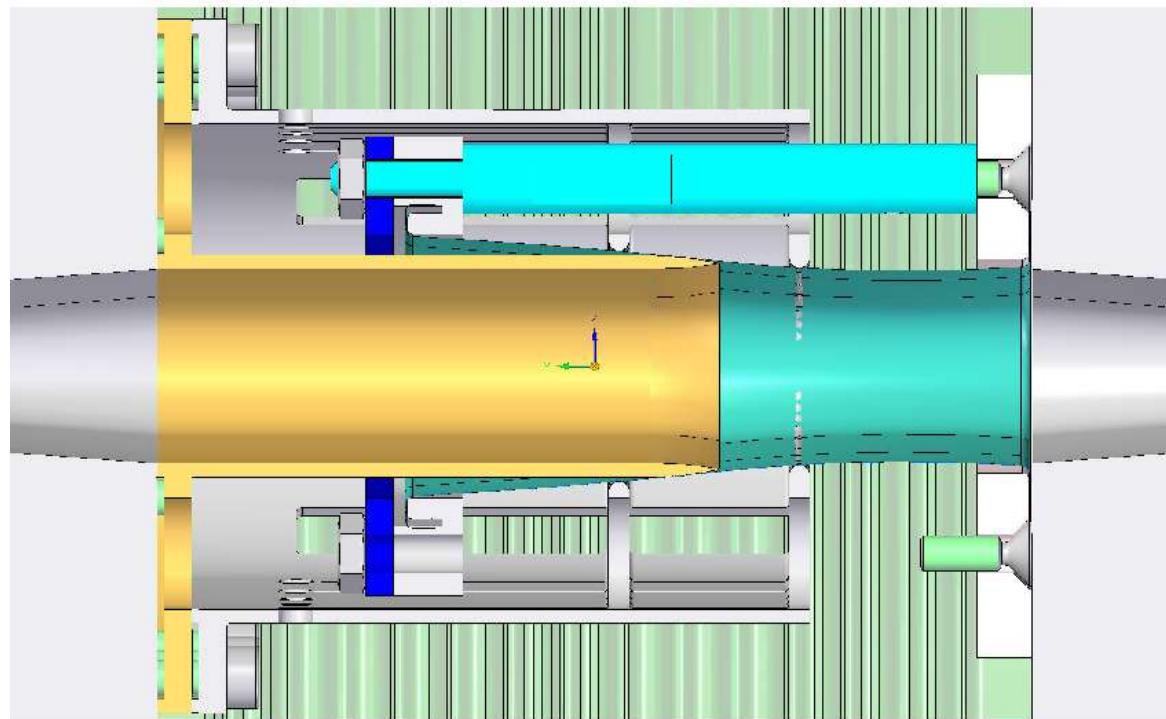

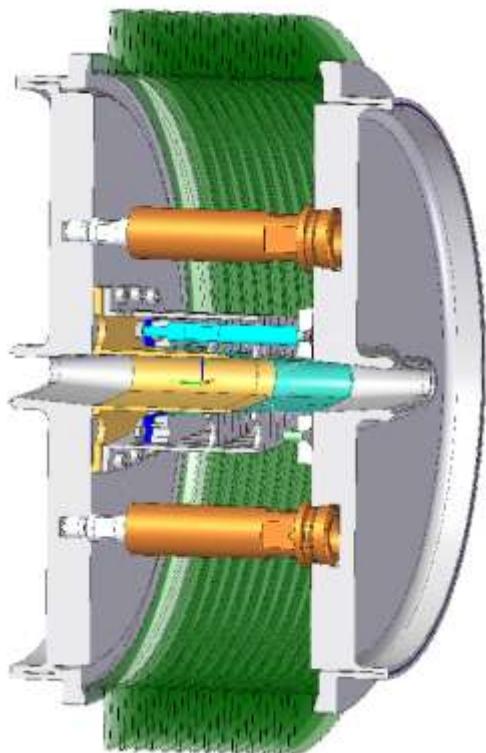

Another fault at 40 Bunches and 85 mA (afterwards: 80 mA).

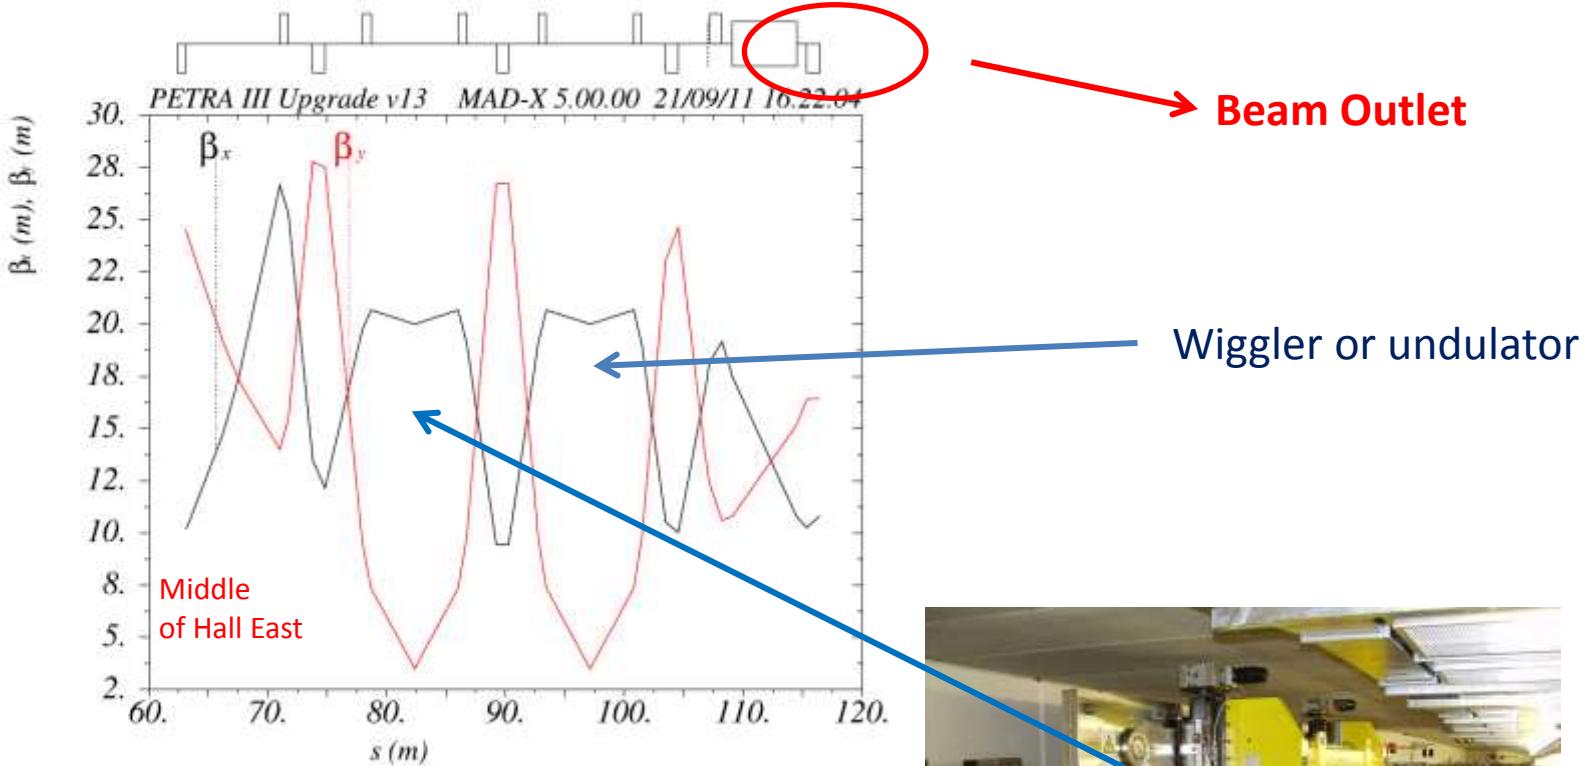

# Technical Problems

- **Bellows:**

Quick repair, but we need a better design (prototype by Christmas):

# Reconstruction of straight in the east

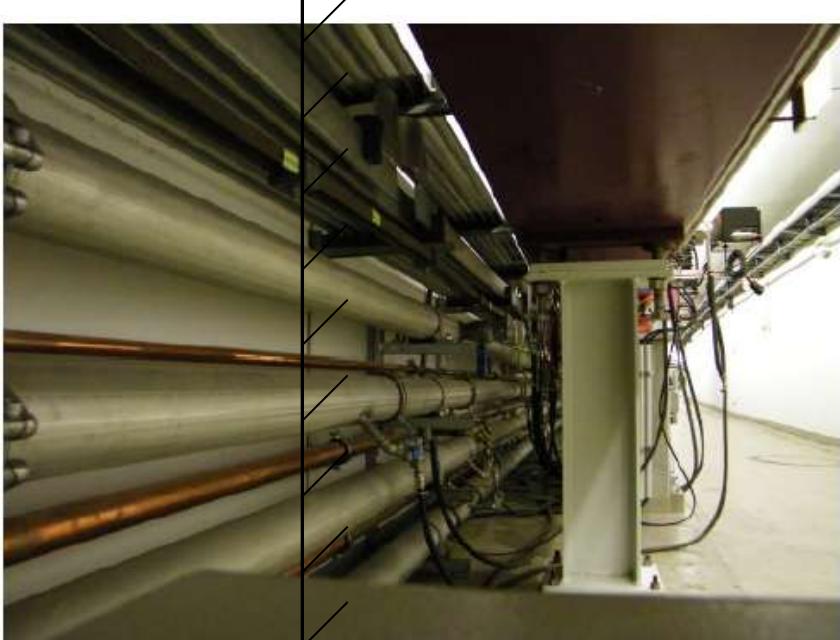

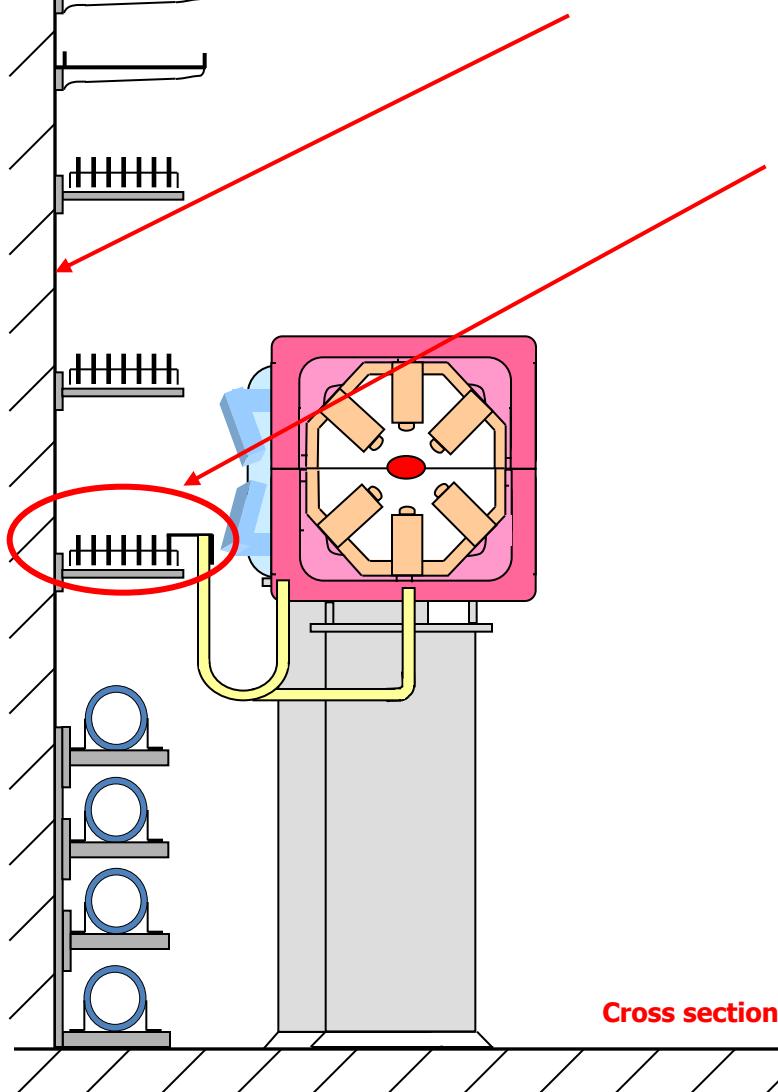

## Required components

- Fast and conventional corrector magnets
- BPM's und Liberas
- HF Momos
- Power-Supplies
- Beam outlet
- Vacuum chamber similar to chamber of 10 m Undulator

Keep existing tunnel to accomplish extension  
in a very short time

Some bus-bars have to be removed  
To find space for beam outlets  
*Details under discussion*

Cross section of PETRA Tunnel (not to scale)

# Beam Stability

According to measurements at comparable places  
(slab of new octant wrt acc. tunnel NO):  
 $\Delta h \leq 10 \mu\text{m}$  (vertical beam size 60 m behind source  $\approx 100 \mu\text{m}$ )
